

## Technical Quick Guides

### License Plate Recognition Gen 2

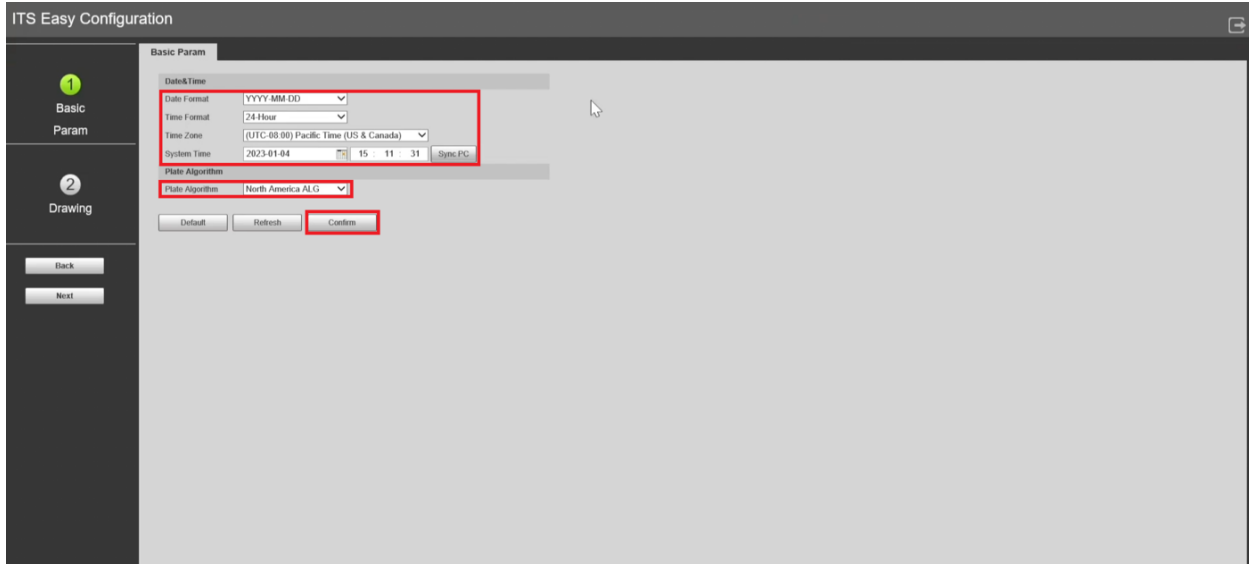

Log in to the Web Interface

Click on the **Guide** tab at the top

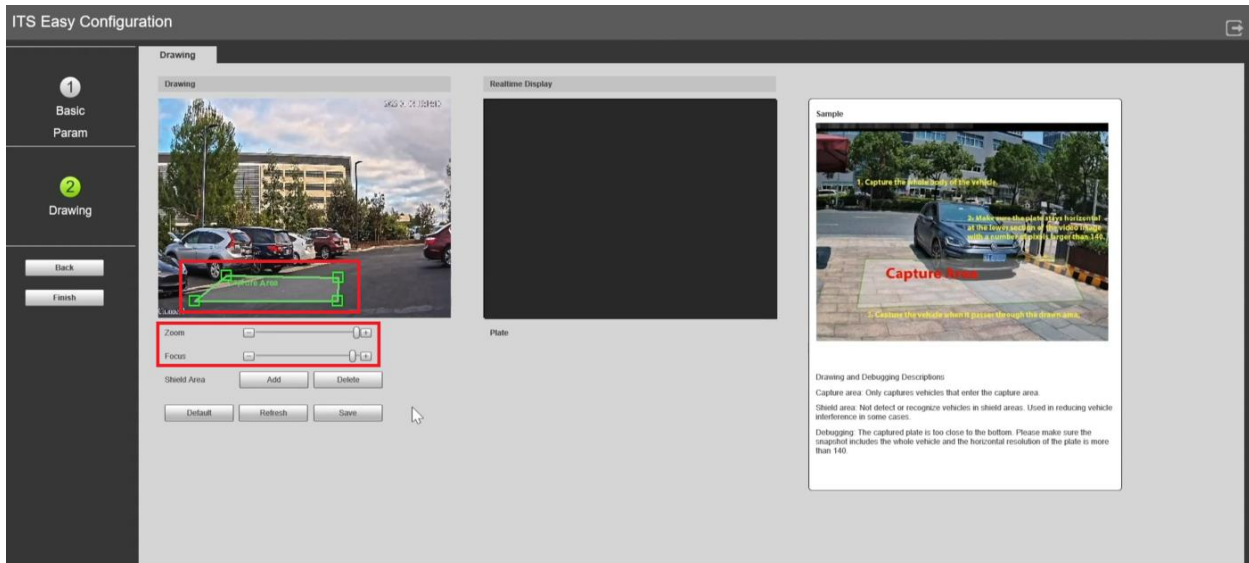

Set the Date and Time settings to match your location's Date, Time, and Time zone. Then click on the **Plate Algorithm** drop-down and select the appropriate option for your location. Click **Confirm**.

Adjust the **Zoom** and **Focus** sliders until the camera is at the right zoom level for the physical setup.

Click on the **Capture Area** box in the **Drawing** live view area and move it around to the desired location for capturing license plates.

Adjust the size and shape of the **Capture Area** box by dragging the four corners to the appropriate location on the live view

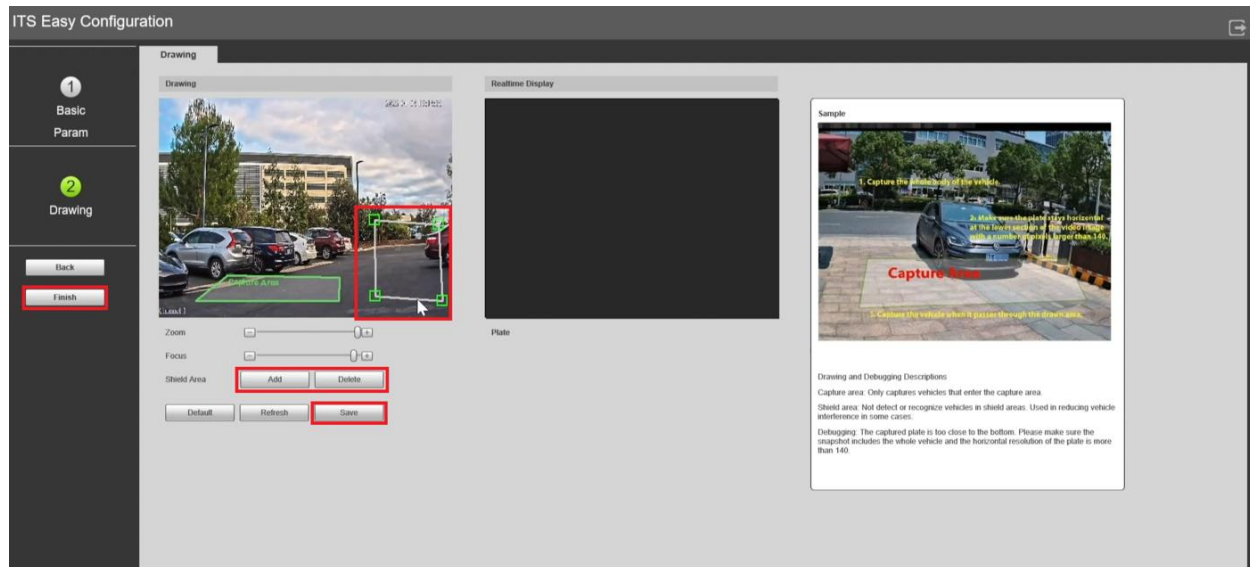

Optionally you can add Shield Areas that avoid looking for license plates.

→ To add a Shield Area click on the **Add** button next to **Shield Area**.

→ Then left click multiple times on the live view to draw the Shield Area box.

→ If you want to delete a Shield area, left click on it in the live view and then click on **Delete**  
When you are done making changes click on **Save** at the bottom and then **Finish** on the left

Drive a vehicle in front of the LPR camera through the detection area to test the license plate capture and recognition setup.

If everything is setup correctly the license plate number in the picture of the license plate will match the text in the **Obtain Plate Info** field.
